### Forward

GREETINGS IRIS FRIENDS.

First let me thank the many hundreds of iris friends and customers for the kind expressions of appreciation for my 1948 Catalogue, and of course, for the many orders which make this catalogue possible. There were so many letters that I was unable to answer all personally, or at the time, so I would like to take this opportunity to say, "Thanks again for your response as well as the many fine suggestions which others might enjoy if I should print them in these pages." You will find some breeding suggestions in this catalogue, again, and I will mention especially fine parents among the standard varieties and novelties listed herein.

I am especially proud of the iris I will introduce this year. They have been selected as superior to anything in their various color classes it has been our good fortune to grow or see in other gardens. They are not perfect iris, but their qualities are good. I think the first requisite of quality in an iris is color (beauty), and next I consider substance of great importance, for how often we see a beautiful flower that melts like snow the minute the hot sun hits it or droops in the first light rain. While I like good branching I have come to appreciate varieties with less and shorter branching as garden subjects. Varieties with low and wide branching may be excellent exhibition flowers, but in the garden the clumps are not always attractive for their flowers are often down in the foliage or on the ground and wide branches sometimes twist among other branches of a plant giving an unsightly appearance to the clump. This is not noticeable, of course, with first year plants, but very much so on two or three year old clumps. Some poorly branched iris are especially beautiful in clumps for mass effect. The same might be said of small-flowered varieties, and these, after all, are unquestionably still the most beautiful for cutting and indoor arrangements for the average-sized

We hope, again, you will enjoy the pursuit of this catalogue and we hope, too, those of you who breed iris to add further beauty to gardens throughout the world, will find some helpful suggestions in these pages, for we all learn by our mistakes as well as our successes. But even so there is no proven sure-fire rule to breeding fine iris. Some "wild" cross may give us an unusual break in color, something extremely large or heavy substanced. Some hybrids like Wm. Mohr, that are notoriously difficult to set seed, will, often, give us a beauty such as Elmohr, and surely Elmohr has substance to put either of its parents to shame, so we cannot say, definitely, that a variety with poor substance will produce that quality in its children, although we can expect some of its grandchildren to inherit this poor substance.

Again let me say Thanks for your many good letters and orders.

Happy irising for 1949 and the years to follow. I am,

Sincerely, TELL MUHLESTEIN

## Our 1949 Introductions

AFTER MIDNIGHT (Storm King x Sable) A large, tall, well-branched dark purple on the order of Sable, with slightly better form. A sister seedling to Night Spot. C. of C. (46-70 C) Midseason. Each \$2.00
BELLE AMIE (John Ohl) (Golden Fleece x Tiffany) Another of those delightful lemon-ice yellows on the order of Cool Lemonade. Belle Amie impressed us as the finest of this color class. It is the lightest in color, a complete self, with excellent branching. Pronounce it "Bella-Me," meaning "Beautiful friend"—a fitting name. Height 38 inches. Midseason. H. C. 1948 as OS 1. Each
BURMESE RUBY (Red Valor x Red Gleam) An unusual red with a jewel-like enamel finish. There is a slight smoky undertone in the falls. I feel it will be an important parent for reds. Height 36 inches. Midseason to late. H. C. (No. 46-122) 1948. Each
GAY ORCHID (Nylon x Golden Eagle) Large Orchid self with flaring falls. A tangerine beard gives it added life and color. Gay Orchid has proven an exciting parent for this same color, pinks and those salmon-pinks. It is a beautiful variety for indoor arrangements. Height 36 inches. Early to midseason. H. C. 1947. Each \$15.00
GLISTENGLOW (Snow Flurry x 44-1: Genevieve Serouge x Mount Cloud) To my mind the most beautiful white iris I have grown. Its branching has been poor, but the individual flowers are as if carved from wax. There is a slight greenish tinge in the strong midrib. The beard is not obtrusive, showing color only deep inside the flower. Early to Midseason. Height 40 inches. H. C. 1947. Each \$15.00
GREENGLOW (Sister to Glistenglow) Here is the iris the "fans" of green have wanted. It is a very large flower, wide of parts. There is some ruffling in the flower, as with Glistenglow; however, the falls are not flaring. This is really a white iris, but there is a strong suffusion of greenish-chartreuse over the entire flower, but more of the color in an outpouring over the falls at the hafts. It has every good quality, height, branching, substance and that certain something (charm, personality) that will appeal to those who like the unusual. Midseason. Height 40 inches. H. C. 1948. Each \$15.00
HOOGIE BOY (Hoogiana x Sdlg: Genevieve Serouge x Salutation) My first real hybrid. Here is a delightful wisteria violet-blue self, with a strong gold outpouring from the wide beard to the hafts. The falls are widely flaring and have a dip in the center giving the flower a jaunty air. Early, it will open the iris season for those who do not grow the dwarfs or intermediates. It sets seed and has extremely fertile pollen on the tetraploids. Remarkable of increase, hardy and easy to grow. No. 47-1. Each \$10.00
NIGHT SPOT (Storm King x Prince Valiant: Joycette x McCall) Tall, rich, black-purple bi-color. The falls flare horizontally, are extremely velvety, rich and free of haft markings. Night Spot will command attention in any planting. It blooms in the late season therefore it should be planted in partial shade to show at its best, but I have always grown it in hottest sun and it holds up remarkably well for such a dark iris. Height 40 inches. Each \$10.00
PINK FORMAL (Golden Eagle x Dr. Loomis' S Q 72) Proud, I am, to introduce this great pink iris to the world. Everyone having seen it has been enthusiastic in its praise. It has the greatest depth of color, the heaviest substance and the finest stalk of any pink iris I have seen, and happily it passes these qualities to its children; in fact many of its pollen children were pink even to the beards. Pink Formal will hold up to any iris in the garden for substance and last-

ing qualities. It is a large flower, somewhat ruffled. The color is deep pink but a pink of salmon origin, although I would not believe this until I tried to find its color in Maerz and Paul's "Dictionary of Color." However, it is pink, and gives great depth of color in the garden. An intense red-tangerine beard lights the flower from within. So heavy, however, is the substance that newly opened flowers do not attain their full growth and normal shape until the second day. The color holds in the hottest sun. I intended to introduce Pink Formal at

\$50.00 each for the stock is small (it is not the fast increaser its sister, Pink Tower, is), however, I feel even the price I have decided on is fabulous, but Pink Formal is a fabulous iris as I am sure you will agree. It is a thrifty and healthy grower. I have not lost a plant since it appeared in 1946, but its increase is moderate only. It branches slightly below mid-section of its stalk—about even with the tips of the leaves, so the flowers are well displayed above the foliage. There are two or three widely spaced branches and a terminal, with from 9 to 12 flowers. The stalk is strong and has never required staking. Height 40 inches. Blooms early to late. H. C. 1947. Each \$35.00 Net

(The following growers have Pink Formal on trial: Mrs. C. G. Whiting, Buryl Harman, Mrs. J. A. Sapp, D. P. Wickersham, Mrs. W. J. Schmelzer, Walter Marx, Robert Schreiner, John Ohl, Mrs. Glen Suiter, Carl Taylor, Tom Craig. In Utah: Fisher Harris, Carl Larsen, Milton Holdaway, and Mrs. Samuel Crosby.)

- STORY TIME (The Red Douglas x Hall's 42-10) A giant. The largest bi-colored burgundy rose (amethyst) iris I have ever seen or grown. Some have referred to its color as Raspberry-purple. It has considerable life and carrying power in the garden. It is one of those varieties almost every garden visitor wants, so I have decided to introduce it at a modest price. The name comes from some of the "big" stories father used to tell us on a Sunday morning (his one day home) when we would crawl into bed with him to listen, wide-eyed, to his breath-taking boyhood experiences or just plain fiction. It is an exciting experience and we think Story Time will add just a touch of excitement to your planting. It is especially lovely en-masse. H. C. (46-5) 1948. Height 34 inches. Early to Midseason. Each

NIGHT LIFE (Muhlestein '48) M (Storm King
x Sable) This was introduced last year, and took the name from a sister seedling not
quite so good; in fact this was so superior the
sister will not be named. This is a very large black bi-purple—the standards are lighter. The
falls are wide and ruffled at the hafts—there
are no reticulations to mar it. Since it bloomed for the first time last year, its height
is not established, but I rather imagine it
will be on the short side. Every garden visitor was taken with it. The stock is so small the price
had to be raised. It is in the gardens of Walter
Marx and Schreiner\$25.00 NIGHT SPOT (Muhlestein '49) See 1949 In-
troductions.

#### HYBRIDIZING HINTS

These notes are offered primarily for the new hybridizer, and they are in no way suggested as completely authoritative, since my findings may be quite different from those of other hybridizers, and surely this will be especially true where difference in climate is great.

Each year I receive letters from friends and other hybridizers in which they mention of bloom late in the season, or after a rain, that they would like to have pollinated, but they had no suitable pollen. If one gathers pollen from the beginning of the season, or even has pollen sent to him from an earlier-blooming section, he will have pollen when needed. I have described the narrow pollen file I use—holding half sheets of typing paper, folded, to make open-topped envelopes in which pollen (on their stamens) is saved. Each envelope is filed chronologically, or in alphabetical order, making the pollen available at a moment's time. It is wise to gather this pollen from freshly opened flowers, but not until the pollen has ripened. It is not good to use capsules or waxed paper since these hold the moisture of the stamens and do not allow them to dry properly and the pollen grains are moistened and spoiled. Here is a sugestion, however, that might make for even quicker location of pollens from various colored flowers: yellow, brown, pink, blue or white — use paper to match these colors.

#### The Tweezers

It is necessary to have a blunt pair of tweezers to remove the stamens from the flowers to be pollinated, or to gather the pollen, and these might be of several types, and some prefer the scissor-type without spring in them—making it easier to hold the stamens when pollinating. To these tweezers should be tied a long string which will hang around the neck, if one is to do much hybridizing—otherwise one is always looking for his tweezers in pocket or box. This is Virginia Clutton's suggestion, and I can vouch for its handiness.

#### Making the Cross

One should select parents with care. Haphazard crossing may result in something unusual, but in most cases only a lot of muddy or ordinary seedlings result, and the work involved is great—even for a small seedling plot. Some iris are great parents, and although old will still be useful for many years to come. Much can be accomplished by careful in-breeding or backcrossing to a given parent, and especially where we need some quality such as color, substance, branching or height. It has been my experience the early blooms are the best for hybridizing since they have more vigor than the last blooms which will produce weak and small pods with very few seeds in them. Of course a fresh bloom should always be used. The best time for hybridizing is usually from one to three hours after the flower has opened; however, in the case of Wm. Mohr and other difficult parents, I have found it useful to open the buds an hour or two before they are due to open normally and pollinate the stigmas while they are tight and still moist—after they have dried out it is useless to put pollen on them, and in the case of Wm. Mohr I pollinate all three stigmas whereas with the more easy tall bearded plants one stimatic lip (found on each of the three style arms) is all that is necessary to pollinate; however, if the stigma is dry, wet (by rain or dew) or injured in any way one will want to pollinate one other stigma or if a take is especially wanted all three stigmas may be pollinated.

#### Look to the Grandparents!

In selecting the actual parents for a cross it is wise to look not only at the parents themselves but also to the grandparents. For example, if breeding red iris, you may want to use that superbly finished Garden Glory so it would be wise to use a red parent to go with it that is wide of parts, and make sure its parents were the same—especially wide of falls, for Garden Glory comes from The Red Douglas and very often produces seedlings that are somewhat long and narrow in falls. Varieties with Dominion blood will help to correct this fault of narrowness, but then you will have to watch out for reticulations or striations on the hafts. Dominion has been a great progenitor especially for "reds" and blues, although it may be found in the pedigree of many whites (Snowking), lovely blends (Midwest Gem, Matula) and even in plicates (Aldura) and other colors, including the coppers such as Radiant, Copper Glow, etc. One should be careful in the selection of parents for narrowness (not always undesirable, however, depending upon the actual beauty and form of the flower) may be difficult to breed out. You may expect narrowness in seedlings of: Naranja, Shining Waters, Melitza, Black Forest, and others, and surely the characteristic will show up in the second and third generation unless extreme care is used. Size, too, may be highly hereditary. Ola Kala, Jasper Agate, Orloff, Naranja, Overture, and Flora Zenor all have a tendency to produce small-flowerd seedlings. One should select parents with size to offset this. As in the case of Flora Zenor its seedlings are usually small, plus a tendency toward the same dirty falls (purple and striations) but its grandchildren and another generation beyond would more than likely improve; however, the work is great and there are other varieties on the market with decided improvement so one would be wasting his time, to a great extent, to breed with such a variety.

#### Those Pinks

Great interest is centered on the breeding of pinks these days. As I have mentioned before one of the truly great parents for this color is Golden Eagle. Coming from Prairie Sunset as one parent, and stemming as well from W. R. Dykes, Dolly Madison and Morocco Rose, it has great posibilities. One may expect lovely shades of Salmon-pink and Orange-pink (perhaps because of the blood of Prairie Sunset) as well as true pinks. It might be well to mention here that Dr. Loomis' Morocco Rose and his first Shell pink (Sea Shell) are half-sisters—both stemming from one parent (F 70, which is out of W. J. Fryer x Ricardi). Undoubtedly Ricardi may be the influence here for the pink color as well as the tangerine beard. I produced a light shell pink from Chosen (which is Purissima, Mirasol and Rubeo blood), crossed with Morocco Rose. Here Purissima as well as Mirasol carry that "mesopotamica" (Ricardi, a form of Mesopotamica) blod. And now Thomas Craig tells us that Mount Washington (also a mesopotamica derivative) is useful in the breeding of these pink-bud iris. Undoubtedly Melitza carries this same blood, for it is of "tender" origin and shows this in itself as well as its seedlings. It is unfortunate that we do not know the breeding of W. R. Dykes, but it, too, must surely stem from mesopotamica or Ricardi blood. Both Happy Days and sister seedling Isabellina carry this blood of mesopotamica and are useful toward pink breeding; however, Isabellina has such poor substance its usefulness may not be great, for although some of its seedlings have fair substance the majority of its grandchildren (at least for me) have been like tissue paper and melt almost before they are open—in fact, some few seedlings never did open properly. While Golden Eagle hasn't the greatest substance it seems to have the happy trait of giving its children good substance as well as great vigor of growth and increase. Golden Eagle has one trait that must be guarded against and that is weak branches (side-stems) and when breeding Golden Eagle one should make sure to stake all stalks that are to bear pods for the wind will often blow its stalks to the ground. Using Golden Eagle as a pod parent, I crossed it with pollen of Dr. Lommis' S. Q. 72 (which unfortunately I have no record of except that I know it is a seedling of Sea Shell) and this variety has a tall stalk with strong branches—the resulting seedlings were nearly all strongly branched; however, several seedlings had collapsible branches, and these were destroyed at once. From this cross, Pink Tower and Pink Formal resulted, and one could not ask for better stalks. Pink Formal has the deepest of color and seems to be the finest kind of pollen parent giving its children great depth of color as well as good substance and fine-branched stalk. Spindrift is proving a splendid parent for pinks, and its grandchildren are, in most cases, vast improvements—having tall, well branched stalks as well as size and clarity of color. I have used Golden Eagle with Spindrift to good advantage. Pink Salmon is from this cross and it, in turn, is proving a splendid parent—giving height (perhaps from Morocco Rose and Golden Eagle blood) to its children. One of the finest new pinks I bloomed last season came from a seedling, 45-22 A (Lancaster x Hall's 42-10), a big yellow crossed with a sister seedling of Pink Formal and Pink Tower 46-22 B. This is a heavily ruffled deep pink with good branching. Its number is 48-69. We can see from this that there is considerable line-breeding since Hall's 42-10 is a seedling of Golden Eagle; however, there is some out-breeding in the use of Lancaster, and although there were not many pinks in the cross this one was superb. Close in-breeding among pinks, or any other color, where the substance may be poor or the size small, will get one nowhere: we must bring in new blood for vigor, size, and substance (of course this is just a theory of my own founded on my limited experience).

#### The Blues

We have a long way to go, yet, to reach the goal of a true blue. Helen McGregor is a beautiful light blue, but it fades in hot sun to white. Azure Skies retains its color quite well as so many others, but they are not true blue. Blue Valley approaches blue, yet it retains much of the texture-veining of its parent, Great Lakes, and this detracts from the flower, as does this same veining in Esquire, Lake Shannon and Great Lakes, but the latter is one of the finest of parents. Walter Welch used Great Lakes on a seedling of his (a sister to Halleluiah: Gudrun x Easter Morn) with astounding results—the texture veining was not present. Blue Rhythm is of the deeper shade of blue and one of the best. It should prove a remarkable parent, as perhaps will Chivalry, Sylvia Murray, Azure Skies, and others. Parents proven in this color are Purissima, Gloriole, Lake George, Blue Spire, Mary Clotilde, Mountain Sky, Sparkling Frost, Blue Zenith, The Admiral, Shining Waters, and others. Coming on the horizon are Pierre Menard and Cahokia (sister seedlings) stemming from Purissima and Santa Barbara blood. Mirror Lake has given me some splendid new seedlings, as have some from Anitra x Great Lakes—these without texture veining, and, by the way, Anitra should be a fine blue parent—it is like Purissima in that it sets seed with ease. The hybrids from Purissima x Capitola—Peg Debagh, Morning Blue and Blue Elegance — may change our concept of flower form, and from these may come better blues, if they will prove easy parents.

The Reds

Important parents in the reds are nearly all descended from Dominion blood. Some good red parents are: Red Valor, Red Gleam, Garden Magic and its children, Garden Glory and Ranger (a difficult parent either way), Christabel (a producer of weak seedlings subject to rot), Flora Campbell, Solid Mahogany, Velvet King, Three Oaks, and Garden Flame. Tiffany produces reds as well as plicates, due, no doubt, to King Tut and Morning Splendor blood. Of course Dauntless, Cardinal, Depute Nomblot, Bruno and Moa (all from Dominion blood) have proven their worth as "red" parents, but some of the newer varieties are advances. Dreamland may be useful, as might Starless Night and some of the newer reds like Apex, Orelio, Drum Major, Redwyne, Redward, Red Torch, Arab Chief, Tobacco Road and Red Ray, the latter a splendid parent for re-blooming iris as are also Radiant, Tiffany, Rosy Wings, and China Maid.

#### The Plicatas

In the plicatas we have an ever-increasing range of colors to choose from. There are the white ground, the yellow ground, and the cream ground. We might expect "brushed" plicatas (sometimes called fancy, or striates) banded, or precisely stitched. Here, too, we must look at the grandparents (or beyond) for plicata carriers since plicata blood is recessive. Elsa Sass, Alta California, Great Lakes, Happy Days, Naranja, Shining Waters, Sea Shell, Purissima and Salar are just a few carrying plicata blood. One of our Robin friends wrote of a cross she made with Great Lakes x Elsa Sass that gave her all plicatas ranging from yellow to white-ground, all of a smooth texture—she was quite enthusiastic about them. Elsa Sass coming from two yellow-ground plicatas should throw this type quite consistently if bred to plicata carriers. To improve the substance and width of this class of flowers, Aldura may become very useful since it carries Dominion blood.

#### The Lemon Yellows

These will come from the plicatas (yellow-ground primarily) and some of these are Elsa Sass, Moonlight Madonna, Misty Gold, Cool Lemonade, Mattie Gates and the new Belle Amie. While they have some resemblance, each is different in form, substance or clarity of color. Some like Mattie Gates, Elsa Sass and Misty Gold have the white area in the falls.

#### The Blends

This class covers many various shades and hues from light, washed-out colors to deep, rich and vibrant colors such as General Patton and Bryce Canyon. There are delicate pink blends such as Remembrance and Midwest Gem, richer blends like Matula and Three Oaks, to Flaming colors like Miogem, Gypsy Rose, Auburn, Aztec Copper, Arab Chief, Bryce Canyon or Rilla Gabbert. Prairie Sunset has been an important parent in this class, and crossed with Tobacco Road it produced a host of fine blends for me—one of which, No. 46-16, proved a wonderful parent; this crossed on many things, including Honeyflow, gave excellent, smooth-textured blends from rich orange to copper and reddish tones. As mentioned last year, Arab Chief x Bryce Canyon gave me several splendid copper-red blends—one of which was named The Showman (H. C. 1948), and these should be useful for line-breeding with other Tobacco Road or Aztec Copper derivatives, which stem from that remarkable progenitor, Far West. Old Parchment x Mellowglow gave me a host of fine blends—one of which I have named Utah Special, a lovely light cream, salmon and other colors blended in a ruffled flower.

#### The Whites

As with the blues we are sitll seeking better whites. Some late new developments are splendid, such as Lady Boscawen, Alba Superba, White Ruffles, Spanish Peaks, Snow Carnival, Jake, New Snow, and Snow Flurry. Priscilla is about the most pure white, and I have seen it grown fully three feet tall. Purissima is still fine where it can be grown and is undoubtedly a superb parent for whites. Snow Flurry, delightful with its ruffling, And Thou, Howdy, Gentle Florence, White Wedgewod and Blue Crown are among the blue-whites, all of which are good.

The Black-Purples

Sable and Black Forest are leaders in this field together with the later blooming Storm King and Indiana Night, and to these I would add my new Night Life and this year's introduction, Night Spot, which comes from Storm King x Prince Valiant—a Joycette Seedling of Mrs. Tharp's. This class will bear new additions. Mrs. Crosby bloomed a beautiful red-black from Sable x Solid Mahogany that is promising.

The Yellows

The field of yellows is great and only a very few are really outstandingly different; however, since yellow plays such an important part in the garden picture it is almost impossible to have too many of them. The most outstanding new yellows seem to be Ola Kala, Berkeley Gold, Admiration, Goldbeater, Ming Yellow, Spun Gold, and that smooth creation of Carl Taylor's, Golden Ruffles, and to add to the confusion of names I would include my own heavily ruffled

Gold Ruffles, even though it has some lines at the haft, but in spite of these it is proving a remarkable parent for yellows, blends and pure pinks, since its sister, 44-67, was a pink-bud break in the same pod and it is, together with other pink lines (unrelated), giving me some splendid pinks with splendid form and good substance.

#### The Creams

Our big surprise last season was Miss Rees' Ruffled Bouquet—a seedling from Snow Flurry x Sunburst. This seemed to us the finest primrose yellow or cream, although we like Creamo, Snoqualmie, Amandine, Golden Treasure and Desert Song. This class could be widened and as Walter Welch suggests, the breeding of whites with yellows will give a host of cream or light yellow seedlings, some of which may be improvements. Desert Song has about the most substance and widest petals, but has texture veining. I think, however, it will prove a wonderful parent for creams, yellows, pinks, and orchids.

#### Purples (Mulberry)

In this class Elmohr stands supreme. Deep Velvet, Purple Moor, Lord Dongan and Master Charles. Burgundy Rose and my new Story Time should be included here. This class could be expanded. The purples crossed with reds will give a great many of these colors, as will the addition of the blood of Inspiration, Starless Night, etc.

#### The Oranges

This class has been slow to come to the front, and no marked stride has yet been made, although some striking iris have been developed, nearly all of which stem from Naranja. Prince Of Orange, Ella Callis, Ta Ming, Damascus and Rocket are a few in the bi-colored orange and yellow class. I feel the oranges from the pink breeding will bring this class to the front very shortly, and I see in them more true orange than is found in these others that are, admittedly, quite yellow. Whole vistas are open to hybridizers in this color class. Almost any iris with Naranja in the background will be a useful parent, such as mentioned above, and Goldbeater, another. Some of these like Ella Callis and Ta Ming sunburn badly, so great care must be exercised in the selection of the proper parents to cross with them. The orange-pinks stemming from Melitza, the Sea Shell pinks and Golden Eagle, will bring us exciting color together with that tell-tale beard—giving us flowers with greatly enhanced color within.

#### The Amoenas

Here is a class that has been slow to improve, and the reason may lie in the difficulty in breeding and germination from these. Wabash has long been a standard of perfection in this class; however, we understand Geddes Douglas of Nashville, Tenn., has some advancements coming from Extravaganza x Wabash that will set a new standard. Edward W. Brenan of Redlands, Calif., has bloomed seedlings from the same cross, some of which are on trial here. Mrs. Crosby of Orem, Utah, bloomed an unusually fine, large one with considerable reddish tones in the falls from Shannopin x Wabash. Size has been achieved. Further refinement will come. There may be much of interest here, yet. I bloomed a fair Amoena from Dorothy Dietz x Mauna Loa, but it is a difficult parent and has no pollen, on occasions. Iris Lent A. Williamson is responsible for most of the Amoenas in existence today and it might still be of use, although with Extravaganza, and its new children, advancement is so great it might not "pay" to go back to such an old iris for breeding, although surely Wabash and Shannopin will yet hold great possibilities in this color class, as will Amigo, although this iris is really a Neglecta and is quite difficult to breed. Many hybridizers have seedlings from Amigo x Wabash, said to be improvements, of a sort, over either parent. From the breeding of Amoenas one may expect varigates to crop up but the things to keep in mind are to improve size, substance and branching.

#### Taking Care of the Seeds

I believe everyone will know how to mark their crosses, but one should be certain to use labels that will not peel or lose their markings before the pods are gathered. Wooden tree labels with copper wire may be used, paper marking tags can be used, some of the new plastic markers or aluminum markers. These should be plain so no mistakes are made at gathering time. If one is working with a plot of Wm. Mohr, for instance, he might drive stakes and cross all flowers in one area with one kind of pollen, thus using only one marker or label for a goodly number of stalks crossed. One label might serve to mark crosses on a stalk by marking it thusly: the top flowers are crossed with the first pollen on the tag—if a branch just below is crossed write "J. B." (meaning Just Below), and if the second branch is crossed differently write "2nd B" (Second Below), or "B" for Bottom, etc. Sometimes one crosses the top flower and the bottom flower with the same pollen. In such an event he can write the pollen parent down and just under this write: Also B or and B. It might be wise, especially during wet weather, to pull down the spathes—those sheaths of green growing upward close to the ovaries for these might hold water, as will the green near each branch, and cause rot before the pods develop.

It often happens accidents occur to pods or stalks before the seeds are ripe. I have found it best to place these on a shelf to finish drying, although some fanciers have used Sugar

Water or water with vitamin BI with good results. Plain water hastens rotting of the stalks and saps the natural nourishment from the ripening seed pods. There is enough strength in the ordinary stalk to ripen one or two pods without other feeding. Watch these broken-off-stalks for aphids, and if some are found the stalks should be sprayed with nicotine sulphate solution, otherwise these insects will take much of the vitality from the stalk. Some fanciers have placed broken-off pods in the moist soil under the plants right in the garden. This might be alright if one had only one or two crosses of this type to watch, but if such pods receive too much moisture will rot before the seeds develop. As soon as the pods turn brown or start to crack the seeds should be shelled out into small envelopes with the cross written on the outside. The envelopes should remain open and the contents shaken occasionally to prevent moulding; however, if the seeds do mould there should be no alarm for it does not seem to interfere with germination.

Here in this section we do not plant the seed until late October or early November. There are many methods of planting seed. One might choose the method most suitable to his time and ambition. If, for instance, one is sure to be able to transplant seedlings early in the season just before the Tall Bearded start to bloom then planting in cold-frames would be wise, or even planting in open seed-beds, where the seed is planted, very closely, and will have to be transplanted. I have found seed planted very thickly seems to germinate well. Whether this is due to the closeness of the seed or some other factor I am not prepared to say. Some fanciers will prefer to plant in rows (furrows for ditches are made), where the seedlings will grow to maturity and will not have to be transplanted; however, there is a disadvantage to this type of growing seedlings for many seeds will fail to germinate until the second or third season and some may even germinate years later. Needless to say, anything that germinates beyond the time one decides to give for this should either be dug and transplanted to another spot or destroyed immediately after they come through the ground. If one has used a seed-bed over a long period of years needless to say the soil should be given some fertility. The best fertilizer of course is either perfect compost or barnyard manure (fine), and not too old, for old wellrotted manure has lost much of its fertility and only the humis may remain. In preparing cold frames or small seed-beds, light soil, humis, light manure, leaf-mould, and fine sand should be mixed in about equal proportions. Commercial fertilizers should be avoided. Seed should be planted from one-half inch to three-fourths of an inch deep where the beds will have shelter of either frames or some other covering such as excelsior, leaves, marsh hay, cornstalks, etc., which will prevent thawing and freezing that often heaves seeds out of the ground. Beds should be weeded regularly at all times to insure access to the food and sunlight they need for full growth. Water on the seed-beds will insure germination. Beds that become dry, before or after germination starts, may do considerable damage to delicate plants or if not enough moisture is supplied from early season until germination is over seed may not germinate until the next year or even later.

#### Marking the Crosses

As mentioned last year, I use India ink to write on the wood stakes which are my markers. Ringed wires (galvanized) might be used to mark crosses in cold frames, or even in the field—in the rings might be tied either a plastic, wood or aluminum marked indicating the cross. Recorded in a book, one might have the various crosses, and rows, just in event a marker is lost or obliterated, as often happens.

#### Selecting Seedlings

When the seedlings actually bloom the important time has come to make selections. Sometimes one wishes to save almost every plant from some crosses, and if a row of blue seedlings are examined in the late evening, after the sun has fallen over the horizon, it is easy to see the finest "Blues" yet produced. One might mark a half dozen only to look at them under sunlight, with the blue sky above for comparison, and the markers will come off immediately. Many a flower has been marked in the early morning only to have the selection tag removed in the afternoon when it has proven to be just another pretty piece of fluff without enough substance to withstand the sun's hot rays. No fancier can judge his seedlings with finality the first season, some seem to improve on second year plants, while others seem to have given a "swan-song" their first year and are never as good again. I believe, however, another season finds us ever more critical and what pleased us last year, or a few years ago, might look like last year's Easter bonnet. Any fancier, too, must grow or have access to a garden growing the latest novelties or he cannot appraise his own seedlings. Unless a seedling shows considerable merit it is hardly worthwhile to keep it, unless for some purpose in breeding. Odd, though, some new plants are such "stinkers" the first season, and some of these might be mentioned: Flora Zenor, White Wedgewood, Miobelle, Black Banner, etc., and I have seen plants of Chamois that one would not look at a second time, so if it were a seedling one might easily pull it up without a thought of remorse.

No doubt many fine seedlings have gone to rest without having a chance to show what they could do, but more often a promising seedling is given its fair chance. Some colors, however, show up better in different soils. Blues, for instance, will look bluer in some localities, and some blends are much richer in certain soils. A safe rule, however, is not to judge a new plant too harshly. Branching, size and color can best be judged on a two year plant. Some varieties like Snow Flurry (in some sections, that is), Elmohr, Blue Rhythm, etc., nearly always give typical bloom on first year plants. However, back to selection of seedlings. If you live in an isolated place and you have no way of knowing how good your pet seedling may be it would be wise if you should send it to a fancier's garden for trial, and don't feel hurt if he tells you, "it is just another nice blend, but not distinctive enough to merit introduction." Because you are a novice don't be afraid to send a plant out for trial—it may be you have a future Dykes Medal iris. Cousin's first introduction, Great Lakes, won him the medal, as did Wills' Chivalry. Miss Rees' first named iris, Snow Flurry, has brought her world fame, and an ever-increasing number of "grandchildren"—a posterity that iris fanciers will thank her for for years to come.

Naming Iris

Hybridizers say it is much easier to produce an iris of quality than to find a fitting name. Personally, I like simple and descriptive names. Hybridizers who understand French or Indian may choose names for their producitons that mean a lot to them but nothing to the majority of fanciers. Many an iris has been boosted to fame by its name, and many a good variety with a difficult name has been greatly hindered. Names like Kachookio, Kahokio, Rangitikia, or even Tishomingo are not likely to find favor among the average, and surely such simple names as Naranja, Ola Kala or Gudrun are difficult enough for some of us to pronounce to say nothing of Jean Cayeux, and Depute' Nomblot. How much easier to pronounce names like: China Maid, Great Lakes, Grand Canyon, Remembrance, Tiffany, Mulberry Rose, Snow Flurry, Black Forest, Sable, etc. Very often just looking at an iris will name it for you. Each flower has its own charm, its own personality, and it will suggest a name if you give the matter a little careful thought. Of course, very often some of the best names have been used and as is often the case such descriptive names as Pink Ruffles, Dogrose, Pink Satin, etc., have been used for earlier productions that were, perhaps, at that time considered pink, but which now are considered lavender or orchid and the names are no longer truly descriptive.

Iris Planting

W. R. Dykes suggested that planting immediately following the blooming period would give excellent results, and that during July the buds were forming for next year's bloom and if disturbed at this time might not bloom the following year. Later planting, however, in August and September was suggested as an excellent time. Some varieties seem to bloom well regardless of the time they are transplanted while others are slow to establish and bloom the first year regardless. One must take into account the climate and weather conditions. Iris transplanted during very hot weather may just "sit" and if watered excessively may rot. Fanciers living in, mild climates can, very often, plant iris all but the very hottest months, where fanciers in colder sections have shorter growing seasons and must plant during July, August and September. Later plantings in cold sections (especially where there is chance of open winters) with thawing and freezing conditions during the winter should cover plants with leaves and wire, excelsior, marsh hay, cornstalks, or some other coarse material that will allow some ventilation without allowing the ground to thaw. Sometimes, however, field mice or other rodents will do some damage to plants so covered, therefore the fancier must understand his problems and act accordingly.

Iris Diseases

I suppose no section of the country is free, entirely, of the common diseases of iris. Rot, of two types, especially, is the worrk of the average iris fancier. Botrytis (Winter Rot) which causes a grev or black mould to grow in the fan and rhizomes will be found in early spring-especially so after a mild or wet winter. It is best to remove all affected parts—being careful to lift these into a box whence they should be burned. The plant, if any is left in the garden, should be treated with a solution of improved Semesan (the strength suggested for use in dipping gladiolus bulbs), Lysol solution (same as for gladiolus dipping), Powdered Gypsum, Sulphur or a strong solution of Potassium Pomanginate, this latter being especially useful against infections of Mustard-Seed Fungus (crown rot) which affects the iris during the summer; however, any plant with this disease should be cleaned of all affected leaves (and these destroyed) then the solution of Potassium Pomanginate applied and the parts left exposed to the sun. Bacterial Soft Rot will appear in the late spring and early summer or fall. The above remedies might be helpful against this disease, but needless to say the affected parts should be cut away, the plants treated and the parts left exposed to the sun. Keeping water away from the plants and insuring good drainage should also help. Mrs. Glen Suiter of Nyssa, Oregon, "swears" by fine wood-ashes as a good preventative of rot—this she "plants" well under the newly set rhizomes. Perhaps it is potash that does the good. Healthy plants which have been given a well balanced "diet" will be more likely to withstand disease than weak plants or plants that are "fat" due to over-watering. Incompletely rotted or composted plant life as well as some kinds of animal or poultry manures may cause types of rot or other diseases. Some types of fertilizers, especially where they come in contact with rhizomes or leaves, will "burn"

the plants, making them easy prey to disease or bacterial infection.

Scorch is the disease which causes plants to turn brown—leaving firm rhizomes without roots. Little is known about this disease, its causes or cures; however, plants have been known to recover from the disease, yet it is generally agreed it is a waste of time to bother with them, for the plant may relapse into the disease or its increase may carry the disease. I'm sure the Scientific Committee would be glad to hear of any successful remedy for the disease.

The Iris Borer is a serious problem in some sections of the country. Fortunately, as yet, we have not experienced this pest; however, once started it could become a serious menace. Dr. Fraim and Mrs. Lowry have had success using a spray of wettable DDT. The plants must be covered every 2 weeks (or after heavy rains) from early spring until mid-summer. Any borers found in leaves or rhizomes should be destroyed, of course.

Lvnn Langford

I have written in length, but this rambling bit is not in any way considered to replace the American Iris Society's new book, "The Iris—An Ideal Hardy Perennial," or other writings far more authoritative, and which every iris lover will want to have in his library. I have given hints and suggestions which I will not cover in future editions of this catalogue; but I will surely welcome any findings you have made and wish to pass on to others, through these pages. I shall be pleased to hear from you, and if you have pedigrees I do not give, or if I have made error, I will, likewise, want to change this.

#### THE BEST-LIKED VARIETIES LAST YEAR

(For obvious reasons I have not included any of my own, or my introductions for others)

Chamois Courtier Blue Rhythm Premier Peach Ola Kala Dreamcastle Good News Cloud Castle Russet Wings Ranger Garden Glory Admiration Aldura Honeyflow Cascade Splendor Ruffled Boquet Miogem Deb's Delight Good News Bataan And Thou Elmohr White Wedgewood Rocket Snow Flurry The Capitol Pathfinder Sylvia Murray Pink Cameo Three Oaks Mellowglow Misty Gold Lamplight National White Golden Symphony Coloratura Gulf Stream Alba Superba Black Forest Solid Mahogany Suzette Helen McGregor Auburn Rilla Gabbert Melodist Cherie Rose Top Gypsy Gypsy Rose Red Torch Cardovan Rajah Brooke General Patton Patrice Amandine Vigil

New Snow Danube Wave Amber Gem Treva Great Lakes Extravaganza Louise Blake Golden Madonna Anitra Master Charles Mattie Gates Moonlight Madonna Garden Flame Orelio Red Valor Orangeman Salmonette Salamonie Bryce Canyon Tobacco Road Grand Canyon

Mary Clotilde

Lady Boscawen

Creamo White Alone

The Oriole

New Horizon

There were other new ones which did not give typical bloom the first year or failed to bloom. Some of these will join the list next season.

Jake

#### TERMS OF SALE

Cash with order. Postage paid on all orders over \$3.00. Orders for less, add 25c to cover packaging and postage.

Shipping Dates

Our Rhizomes mature here after July 15th; however, we will start shipping July 1st, if so desired.

#### Discounts — Extras

We offer a 25% discount on all orders over \$10.00. Or if you prefer, give us a list of extras which you would enjoy-even some quite new and expensive ones for we often have good stocks of these and would like to have you try them in your garden. We like to be generous. No discount on varieties marked "Net."

Replacements

. We will replace any variety you have purchased from us which fails to live or is untrue to label.

#### An Invitation

Join the American Iris Society. Its four big quarterly bulletins will give you interesting and authoritative information on iris culture, arrangements, color combinations in the gardens, notes on interesting species, suggestions to hybridizers, historical and breeding records, registration and exhibition policies, annual lists of favorite varieties, varietal comments, award winners, and news of iris activities everywhere.

Dues are \$3.50 per year. Mail check to us or direct to American Iris Society, 444 Chestnut St.,

Nashville 10, Tennessee.

The best book available on irises is "The Iris—An Ideal Hardy Perennial." It is a "must" for all iris enthusiasts. Paper bound, \$1.50. Permanent binding (the most practical if you expect to use it much) \$2.50. You may order this from us or directly from the American Iris Society (address above). Or take advantage of the offer below, if you are not already a member of the American Iris Society.

Special Offer to Those Not Already Members of the Society:

The Book, "The Iris—An Ideal Hardy Perennial," and one year Membership in the A. I. S., and these 8 exotic iris: Elmohr, Great Lakes, Mount Timp, Ormohr, Tiffanja, Three Oaks, Wabash, and Wm. A. Setchell (if you have some of these you may use any of the following as substitutes: Cream Gold, Aldura, Late Guest, Dawn Overlay)—

A \$15.00 Value - All for Only \$10.00

(if you want the permanent binding, add \$1.00 to the above)

To enlarge our membership in Region 12 any fanciers in Utah, Arizona and New Mexico may take advantage of the same offer, but I will include as a gift my new introduction, After Midnight. Or you may send your membership dues of \$3.50 to me and I will send you either Cream Gold or Mount Timp free of charge. This is for new members only, but I personally solicit the help of old members to bring this offer to the attention of new fanciers in these states.

An invitation to Utah iris lovers. Join our Utah Iris Society. If you are interested write for

further information.

#### Pink Seedlings

We have some fine numbered pink seedlings, new seedlings from Pink Formal last year, and many more to bloom this season. Pink seedlings under number will be sold at \$2.00 each. Some unnumbered pinks from Pink Formal crosses will be sold at \$3.00 each. Sister seedlings, or other colors, not pink,, will be \$1.00 each, pedigrees furnished.

#### Pollen

Pollen of Pink Formal will be sold from May 20th to 30th at 5.00 per 9 stemens. Other Pollens at 10% of Catalogue price per rhizome.

#### Tall Bearded Iris Seed

Last year I offered to make crosses, and in many instances it was possible to make these, but some varieties were spoiled with rain, failed to bloom, had no pollen, or failed to set seed, etc., and some disappointment naturally resulted, although most fanciers were pleased to have me substitute some of my own work in the same color classes, so this year I will again offer seed, and you may suggest colors, or one parent. Not less than 20 seeds from a cross will be sold due to the work and time involved in making the crosses, labeling, and writing the envelopes, etc. You are more likely, anyway, to get something better from 20 seeds than you would from only 4 to 5 seeds.

Seeds will be 5c each in any color class. Crosses, however, from Pink Formal used either way will be 10c each. I will not offer seed this year from such difficult parents as the hybrids (Elmohr, Suez, etc.). But I will be glad to make some crosses using my Hoogie Boy if you so desire these

but let me know early. These will be IOc each (as pollen parent).

Seed will be mailed about September first. Do not ask for less than 20 seeds from a cross.

Count will be good.

SPECIAL: Chance seeds gathered from unusual crosses in pinks, blends, whites, blues, coppers, oranges, and plicatas, \$1.00 per envelope (mixed blend) about 100 seeds.

#### Visitors Welcome

We especially invite visitors attending the Portland meeting to come to Utah after the A. I. S. meeting May 14th to 16th. Our peak bloom is usually May 17th to 30th. There won't be much to show before May 17th.

#### Have You Changed Your Address?

If you have moved and wish to remain on our mailing list kindly notify us of your new address—giving your old address as well.
